will my web hosting deluxe support java spring boot application?

Agent at 04:39 PM, June 10

No, Web Hosting Deluxe usually is not a fit for a Java Spring Boot app.

Spring Boot typically needs a persistent Java process, custom server configuration, and more control than shared web hosting provides. For that kind of app, you'd usually want a VPS or dedicated server environment instead.

Are you trying to deploy a new Spring Boot app, or checking whether an existing hosting plan can run one?

You at 04:40 PM, June 10

then how python applications are running in my web hosting deluxe

Agent at 04:40 PM, June 10

That's because Python on Web Hosting Deluxe is usually limited to the hosting features the plan supports, like CGI/WSGI-style web apps or specific shared-hosting configurations, not full server control.

Spring Boot is different because it commonly runs as a long-lived Java service and needs process management that shared hosting typically doesn't allow.

Are you running a simple Python site through cPanel, or a custom app that starts its own background process?

You at 04:41 PM, June 10

i am trying to check wheather my exiting plan will deploy my springboot application

Agent at 04:41 PM, June 10

Your existing Web Hosting Deluxe plan is generally not meant to deploy a Spring Boot app.

It can handle some shared-hosting workloads, including certain Python setups, but Spring Boot usually needs a continuously running Java process and server-level control. That's why it typically needs a VPS or dedicated environment instead.

Does that answer whether your current plan can run the Spring Boot app?
